

Detailed geological and structural mapping was conducted across 35 sq km in the Schirmacher Range. Rock samples were also collected for analysis. Microbiological studies were conducted on the freshwater lakes. Researchers measured biological productivity, bacterial counts, and variations in microbial activity over time.

The marine biology program focused on sampling zooplankton, particularly krill, from different parts of the ocean to study their distribution and abundance.

Their male teammates took a while to be more accepting of their presence. Dr. Pant was primarily on the ship as a marine biologist while Dr. Sengupta did field work on the continent.
